LINES AND BARS: High contrast colors.

65 COLORS Requested

12 different color categories with 5 grayscale levels in each category. + 5 spare masters.

DELIVERABLES

PDF Style Guide with swatches showing 48 colors for 10 categories with 4 grayscales.

Colors are defined using HTML Hexcode numbers.

HUMAN LIMITATIONS: COLOR PERCEPTION

Lowest grayscale of any category must be 30%.

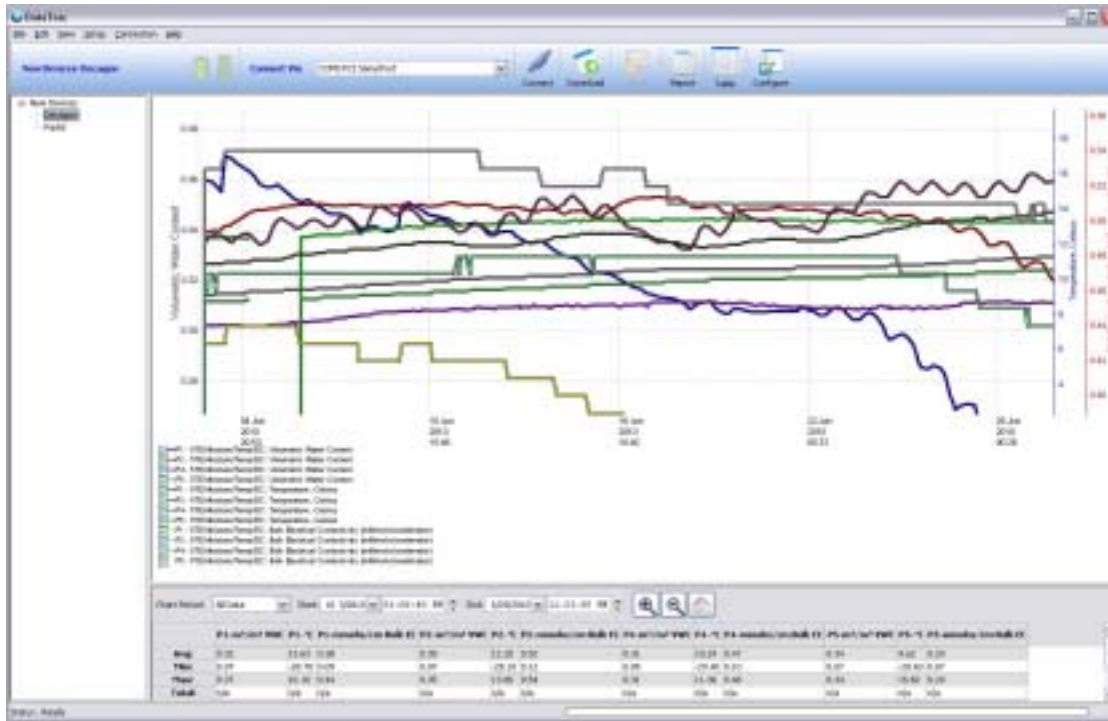

Yellow is forbidden as it is too close to white. Gray is forbidden because those are just tints of black.

MEASUREMENT --categories

1. Volumetric water content (VWC)
2. Temperature
3. Electrical Conductivity (EC)
4. Leaf Wetness
5. Precipitation
6. Wind speed
7. Radiation (undefined)
8. Humidity (RH)
9. Photosynthetically Active Radiation (PAR)
10. Water Potential
11. Air Pressure (undefined)
12. Drainage

Data colors

While there are millions of colors to choose from — there are limitations for human perception of color differences.

The color set is limited to elemental “crayon” colors and their tints (grayscales.) When rainbow colors are too close, they become unusable as differentiators— especially on electronic displays which vary in age and settings.

Only 44 colors are recommended and even that is pushing human patience and tolerance.

A primary goal is to reduce visual noise and improve human interpretation of complex data.

Where more than four colors are needed for one parameter, it will be necessary to use dashed lines or other symbols in charting more data.

There is a hierarchy. The solid color should be assigned first and then descend to lighter tints in order. This will create a subtle “depth illusion” on screen.

These two end swatches show how difficult it can be to differentiate colors in some cases. Here they are almost identical at 30%.
